

Aqueous Vets' Quick Ship Program provides emergency treatment for PFAS Compliance.

CHALLENGE:

For some municipalities, PFAS concentrations are exceedingly high or approaching the maximum contaminant level (MCL). It's not feasible for the water utility to wait 12–24 months for the manufacturing and installation of a system while purchasing water from an outside water purveyor.

SOLUTION:

AV's Quick Ship Program allows utilities to rely on the best available technologies to treat water and keep all wells online. The PF 12-520 series can treat flows from 700 gpm to 2000 gpm utilizing ion exchange resin.

RESULTS:

Beyond the value of AV LowPro[®] systems, the Quick Ship Program offers immediate protection, allowing utilities to do what they do best – focus on serving clean water.

FAST TRACK MEDIA PILOTING

Because all water is not the same, our fast-track piloting program expedites the process from testing to installation, ensuring you choose the right filtration media. AV's on-site pilot equipment is capable of testing up to eight media types and replicates real-world fluid dynamics.
